No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/770,379
FILING DATE:
CLASSIFICATION: 435
ATTORNEY/AGENT INFORMATION:
NAME: White, John P.
REGISTRATION NUMBER: 28,678
REFERENCE/DOCKET NUMBER: 52342
TELECOMMUNICATION INFORMATION:
TELEPHONE: (212) 278-0400
TELEPHONE: (212) 278-0400
TELEFAX: (212) 391-0525
INFORMATION FOR SEQ ID NO: 20:
SEQUENCE CHARACTERISTICS:
LENGTH: 32207 base pairs
TYPE: nucleic acid
STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: DNA (genomic)

The PNS and proteins of the invention are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, hematopoiesis regulating activity, tissue growth activity, hemostatic activity, chemostatic/chemokinetic activity, hemostatic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumor invasion suppressor activity, and tumor inhibition activity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polynucleotide sequence of the pt127_1 clone

This sequence was isolated from HSV-2 strain SB5 (deposited as ATCC VR-2546), is designated Contig ID 100, and encodes 6 HSV-2 proteins. The proteins can be used for the treatment or prevention of disease, to induce an immunological response in a mammal or to identify inhibitors, activators or novel antivirals. Antagonists of the proteins can be used to inhibit a viral polypeptide. The DNA sequence or a vector containing it can also be used to induce an immunological

The polypeptides and DNA encoding them are useful in the production of vaccines for the treatment of leucocytozoanosis of fowl.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 1686 BP; 915 A; 129 C; 382 G; 260 T; 0 other;

The full sequence, with introns, is shown in T17116 Substitution of histidine for the normal nonpolar amino acid proline at position 23, by substitution of C with A in codon-23, results in a dysfunctional or absent molecule, affecting rod function, and is linked with autosomal dominant retinitis pigmentosa. Probes T17117 and T17119 bind to the C-to-A representation sequence, and probes T17118 and T17120 bind to the corresponding normal sequence. Primers 485 (T17122) and 502 to the corresponding normal sequence. Primers 485 (T17121) to amplify mutant and normal sequences, respectively, by PCR. Mutations in the retinal degeneration slow protein and retinal rod cGNP-phosphodiestorase genes are also implicated in retinitis pigmentosa. Detection of any of these mutations in a foetus or
                                                                                                                                                                                                                                                                                                                                                                                             Ratio:

                                                                                                                                                                                                                                                                                                                                                                                                  Staphylococcus aureus Union? The sequence of the BacRI operon of CC was determined by N-terminal sequencing of purified BacRI operon CC (see W54171), with back-translation and plasmid analysis. The BacRI operon includes the BacRI gene (see V21510), a homologue of the cylM gene of the cytolysin operon of Enterococcus faecalis. CC whose function is involved in the maturation of pre-cytolysin, CC lactococcin biosynthesis and modification, and a gene Involved in CC immunity function. BacRI peptides can be produced by construction CC of an expression vector containing an oligonucleotide or operon CC coding for BacRI, and use of the vector to transform host cells for CC plasmid publio, and Bacillus subtilis transformants secreted the CC expression. The entire BacRI operon has been cloned into CC plasmid publio, and Bacillus subtilis transformants secreted the CC expression secretical peptides can be produced by construction CC coding for BacRI, and use of the vector to transform host cells for CC sagainst many Gram-positive and Gram-negative organisms such CC staphylococcus aureus; Moraxella bovis, causing infectious bovine CC used as an anti-cancer agent.

These clones, and a clone for VN2 (sequence not provided), were isolated from rat vomeronasal organ cDNA (libraries by PCR and hybridisation. A differential cloning method was used to isolate VN7 cDNA (T69545). VN1-VN7 (not VN2) clones have been deposited in pBluescript as ATCC 97294-97299. A human homologue, HG25 (T69551), has also been isolated. VN polypeptides can be expressed in host-vector systems for use in identifying modulators for control of maternal, reproductive and social behaviour, to increase fertility, control hormone secretion and to
